

Strategic Proposal: Building a 1,000-Company ICP-Qualified Database

Report Prepared By: Yalla Abhiram
Date: 29/5/2026

Objective

The primary goal of this project is to architect a validated database containing 1,000 India-based companies that align with the "Federer" Ideal Customer Profile (ICP). This initiative moves beyond bulk lead generation, focusing instead on identifying specialty pharmaceutical and manufacturing-oriented firms through evidence-based qualification. The system balances operational realism with high-quality data extraction to minimize false positives.

1. Initial Company Universe

The sourcing strategy utilizes multiple independent signals to construct a robust raw pool, reducing reliance on any single directory.

Data Source	Purpose
PharmaCompass	Specialty pharma manufacturer discovery
IndiaMART	Mid-sized manufacturer identification
LinkedIn Sales Navigator	Assessment of employee counts and hiring trends

Data Source	Purpose
CPHI India Lists	Identification of export-oriented pharma manufacturers
Pharmexcil	Access to verified pharmaceutical exporter directories
CDSCO References	Validation of manufacturing licenses and compliance
Zauba Data	Shipment and export activity validation

- **Target Universe Size:** 8,000–12,000 raw companies.
- **Final Validated Goal:** ~1,000 ICP-matched companies.

2. Automated Enrichment Pipeline

The qualification process employs a custom Python-based pipeline that leverages Large Language Models (LLMs) to transform unstructured data into verifiable intelligence.

Stage 1: Website Scraping

The scraper targets critical pages (Homepage, About, Leadership) to extract manufacturing capabilities, facility descriptions, and regulatory certifications.

Stage 2: Search Enrichment

DuckDuckGo search queries supplement website data by gathering external signals such as USFDA references, facility expansions, and technical leadership profiles.

Stage 3: LLM-Based Classification

Gemini API converts raw text into structured analysis, assigning scores based on manufacturing strength, Indian operational presence, and growth indicators.

3. Qualification & Scoring Framework

Companies are evaluated using a weighted scoring model where every point must be supported by specific, verifiable evidence.

Criterion	Description
Manufacturing Strength	Evidence of specialized production (APIs, Injectables, etc.)
Operational Presence	Established infrastructure and facilities within India
Differentiation	Non-commodity positioning or niche therapeutics
Technical Leadership	Founders or DMs with scientific/chemistry backgrounds
Sector Tailwinds	Alignment with high-growth sub-sectors
Growth Indicators	Recent hiring, exports, or new facility approvals

4. Quality Control Strategy

A four-layer QC system is implemented to eliminate traders, distributors, and inactive firms.

- 1. **Rule-Based Filtering:** Automatic removal of hospitals, diagnostic centers, and CRO-only firms.
- 2. **LLM Evidence Validation:** Verification of specific claims such as GMP certifications or export operations.
- 3. **Manual Review:** Human audit of borderline cases to confirm manufacturing legitimacy.
- 4. **Random Audits:** Weekly spot checks on accepted companies to monitor and maintain low false-positive rates.

5. Execution Timeline

The project follows a structured four-week deployment plan.

- **Week 1: Universe Building** — Sourcing and normalizing 8k–12k raw entries.
- **Week 2: Automated Enrichment** — Running the scraping and Gemini-assisted scoring pipeline.
- **Week 3: Validation & Filtering** — Removing noise and validating operational maturity.
- **Week 4: Final QC & Packaging** — Final manual audits, evidence verification, and formatting.

6. Expected Funnel Yield

Stage	Estimated Company Count
Raw Sourced Companies	10,000
Likely Manufacturers	4,000
Strong Specialization Signals	2,200
Validated Operational Firms	1,300
Final ICP-Qualified Database	1,000

7. Risks & Constraints

- **Data Availability:** Private firms may lack detailed financial disclosures.
- **Website Quality:** Operationally strong firms may have outdated digital presences.
- **AI Classification:** Risk of LLM overfitting on weak evidence, mitigated by manual review layers.
